2. SYNTHESIS/CONCLUSION

-We detect the presence of the following chemical substances in a mix of the whole components of the diaper:

AOX (absorbable organic halogens) : 0,5 (LOQ : 0,5) mg/kg

-After a retest on AOX, the result is inferior to the LOQ. Thus, in conclusion, no chemicals substances have been detected in a mix of the whole components of the diaper.

-For the analyses in post migration, no detection has been observed according to our LOQ with synthetic urine simulant (SCL PROTOCOL).

Chemical analysis in a mix of the whole components of the diaper

EOX/AOX

The parameters AOX and EOX are sum parameters. Org. halogen compounds of Cl, Br and J are determined. These are in-house procedures based on the standards for AOX and EOX (see below).

AOX

The procedure for the determination of organic halogens in solids is as follows. First, the sample is eluted with hot water. Then the organic halogens dissolved in the water are determined using the methods standardized under the term AOX analysis (DIN EN ISO 9562). Water-soluble and thus mobile organic halogen compounds are thus detected. As this is a sum parameter, it is not possible to identify individual substances.

Alternative: For the determination of samples with an absorbent core we have developed a sample preparation variant. Here the aqueous extract is not prepared by hot water extraction but by elution over 8 hours at 40 °C using 2% sulfuric acid. The actual analysis of the aqueous extract according to DIN EN ISO 9562 is identical.

EOX

The sample is rubbed with silica gel and then extracted with ethyl acetate. The extract is burned in an oxygen stream according to DIN 38414-17. The halogen content is then determined microcoulometrically.

We are accredited for these process routes (determination of organic halogen compounds) according to DIN EN ISO/EC 17025.

Allergens

The aim of this method is to search and quantify the allergens according to the European regulation 1223/2009. The method is based on extraction of allergens from the product to test with tert-butyl-methyl-ether (inert and not volatile solvent). For identification and quantification of allergens, the liquid is injected directly in a system: gas chromatography coupled with mass spectrometer.

The analysis is performed on the whole components of the product (on a mix of the whole product).

Azo dyes ISO 14362-1 :2017 – GC/MS

Liquid extraction in a buffer solution and purified then measurement by GC-MS according to the standard ISO 14362-1 :2017.

According to the arylamine standard, the test consists of applying the Sample with a Buffer Solution at 70°C for half an hour, after that it is reacted with sodium dithionite, which reduces the amine for another half hour at that temperature.

After this time, the sample is cooled to stop the reaction and the extracting solution is done through diatomaceous earth cartridges, where aliquots of tertbutyl are passed to make a liquid-liquid extraction. The amines turn from the aqueous solution (which is trapped in the column) to the tertbutyl solution. Once the entire organic phase turns to a balloon, it is rotavaporated and its volume is reduced to 2ml - that extract is the one that is analyzed in GC-MS.

Allergic and carcinogenic dyestuff DIN 54231 :2005 – LC/DAD

Detection of disperse dyes according to standard DIN 54231

0.5±0.01 g of sample treated with methanol (7.5 ml) during 30 min at 70°C±2 with ultrasounds

Chemical analysis post migration in a synthetic urine simulant (ANSES note dated the 9th of March 2020 - Demand N°2019-SA-0076)

Migration preparation test in simulated urine - Preparation test - SCL Protocol

Random sampling of the diapers from the CUS provided. Impregnation of each diaper with 200 ml of simulated urine every 15 minutes until total volume to be injected according to the size tested (ex: 800 ml for size 4). The impregnated diapers are laid flat then covered and placed in an oven at 37°C for 16h. After these 16h, the diapers are pressed with a strength of 800 N for 5 min in order to collect the urine.

Polychlorinated biphenyls (12 WHO PCB): water, drinking water, sewage - GC-MS/MS - Internal

This analysis consists in determining the PCBs content on a synthetic urine simulant obtained after migration (SCL protocol). The method is by GC-MS. The extraction of Polychlorinated biphenyls is carried out with toluene (Soxhlet method). The quantification is performed by gas chromatography combined with a mass spectroscopy (high resolution).

Polychlorinated dibenzodioxins and -furans (17 PCDD/F): water, drinking water, sewage - GC-MS/MS - Internal

The aim of this method is to search and to quantify the dioxins (Polychlorinated dibenzodioxin / PCDD) and furans (Polychlorinated dibenzofuran / PCDF). This on a synthetic urine simulant obtained after migration (SCL protocol)

There are 75 PCDD and 135 PCDF but only 17 are recognized as toxics for man:

Tetrachlorodibenzodioxin, Pentachlorodibenzodioxin, Hexachlorodibenzodioxin (3 conformations), Heptachlorodibenzodioxin, Octachlorodibenzodioxin, Tetrachlorodibenzofuran, Pentachlorodibenzofuran (2 conformations), Hexachlorodibenzofuran (4 conformations), Heptachlorodibenzofuran (2 conformations), Octachlorodibenzofuran..

The extraction of PCDD and PCDF is carried out with toluene (Soxhlet method). The quantification is performed by gas chromatography combined with a mass spectroscopy (high resolution).

PAH acc. to EPA+EU (low LOQ) - GC-MS/MS - Internal Method

The aim of this method is to search and to quantify the polycyclic aromatic hydrocarbons (PAHs) on a synthetic urine simulant obtained after migration (SCL protocol)

Sample clean-up by automated solid-phase extraction (SPE) and measurement by GC-MS/MS.

Formaldehyde (free and bound) in materials - LC-UV - Internal Method DNPH derivation Internal

The aim of this method is to search and quantify the formaldehyde (CMR substance: carcinogenic, mutagenic and reprotoxic) on a synthetic urine simulant obtained after migration (SCL protocol).

Liquid chromatography/UV detection using dinitrophenylhydrazine DNPH as derivative

Extractable content of phthalates - GC-MS - CPSC-CH-C1001-09.4

Samples with expected high content is diluted before analysis.

The extract is injected to a gas chromatograph with mass selective detector (GC-MS), where the quantitative analyses of the components are performed from calibration standards in the same sequence. Control samples of both high and low levels and a method blank are also carried out.
